

# Live Dashboard — Section Guide

Every section explained with **real patients from 13 August 2026** (108 appointments).

## How a patient is judged

Today's reading is compared with that patient's **last reading**, test by test.

- **Main tests (decide the verdict):** HbA1c · Systolic BP · TSH
- **Supporting tests (can raise a flag):** FBS · PPBS · LDL · TG · HDL · UACR · eGFR
- **Only displayed:** Weight, BMI, Diastolic BP, liver tests, Hb

### Target bands

| TEST        | GOOD       | BORDERLINE   | BAD         |
|-------------|------------|--------------|-------------|
| HbA1c       | $\leq 7$   | 7–9          | $> 9$       |
| Systolic BP | $\leq 130$ | 130–140      | $> 140$     |
| FBS         | $\leq 130$ | 130–180      | $> 180$     |
| PPBS        | $\leq 180$ | 180–250      | $> 250$     |
| LDL         | $\leq 100$ | 100–130      | $> 130$     |
| TG          | $\leq 150$ | 150–200      | $> 200$     |
| HDL         | $\geq 40$  | 35–40        | $< 35$      |
| UACR        | $\leq 30$  | 30–300       | $> 300$     |
| eGFR        | $\geq 60$  | 45–60        | $< 45$      |
| TSH         | 0.5–4.5    | just outside | far outside |

### Four rules, in order:

1. **Band change decides it** — even a tiny move counts if it crosses a line.
2. **Both readings in the good band** → **stable** (ignore healthy-range jitter).
3. **Change smaller than the minimum** → **stable**. HbA1c 0.3 · BP 5 · TSH 0.5 · FBS 15 · PPBS 20 · LDL 10 · TG 20 · HDL 3 · UACR 10 · eGFR 5.
4. **Otherwise direction decides.**

## Top row — today's numbers

| BOX                      | TODAY           | MEANING                             |
|--------------------------|-----------------|-------------------------------------|
| Today's appointments     | <b>108</b>      | Everyone on the list                |
| HbA1c on file            | <b>74 / 108</b> | Amber because 69% (green needs 80%) |
| Getting worse ↑          | <b>13</b>       | A main test deteriorated            |
| ⚠ Mixed signals          | <b>25</b>       | Signals contradict each other       |
| Stable                   | <b>7</b>        | Nothing meaningfully changed        |
| Getting better ↓         | <b>10</b>       | Main tests improved cleanly         |
| First reading — no prior | <b>44</b>       | Nothing to compare against          |

⚠ **13 + 25 + 7 + 10 + 44 = 99, not 108.** The missing **9** patients have a previous reading for a *supporting* test only (no old HbA1c, BP or TSH), so no verdict can be given. They are counted in the total but sit in **no** box. This is a known gap.

## 🔴 Biomarker Coverage — 69%

**Shows:** 74 of 108 appointments have HbA1c on file → **34 missing**. Amber because it is under 80%. Those same 34 patients are listed in the "No biomarkers yet" card at the bottom.

**Why it matters:** without HbA1c the dashboard cannot judge that patient — they fall into "First reading" or the 9-patient gap.

## 🔴 HbA1c Trend — 55 trended

**Shows:** Better 10 · Stable 7 · Worse 13.

The centre says **55** because "trended" also includes the **25 Flag-for-review** patients — they had something to compare, they just came out mixed.

⚠ **Read the percentages carefully.** The card shows "*Stable 7 · 58%*". Seven patients out of 55 is really **13%**. The Stable slice is calculated as *whatever is left over* after Better and Worse, so it silently absorbs the 25 mixed patients. Trust the **counts**, not the Stable percentage.

## Today's visit flow

Workflow only — lab values are ignored here.

| ROW         | TODAY    | MEANING                      |
|-------------|----------|------------------------------|
| With doctor | <b>5</b> | In the consultation room now |

| ROW        | TODAY     | MEANING                                  |
|------------|-----------|------------------------------------------|
| Checked in | <b>23</b> | Arrived, waiting                         |
| Pending    | <b>69</b> | Booked, not yet arrived — see note below |
| No-show    | <b>10</b> | Did not turn up                          |
| Cancelled  | <b>1</b>  | Cancelled                                |

"Seen" is missing because nobody has finished a consultation yet (it is 17:48 but the count is 0). Rows with zero are hidden. Total = 108. ✓

**Pending is not a real status — it is the leftover.** It is calculated as 108 minus Seen, With doctor, Checked in, No-show and Cancelled. That is why the six rows always add up to the total exactly, and it also means any appointment with a missing or unexpected status silently lands in Pending.

## Getting worse — 13 patients · 24%

### Condition

**Any main test (HbA1c, SBP or TSH) got worse.** Sorted with the biggest deterioration on top.

### Why these patients are here

| PATIENT                              | WHAT HAPPENED                                         | WHY IT COUNTS AS WORSE                                                                                            |
|--------------------------------------|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Mrs. Anjali Sharma</b><br>12:05   | SBP <b>+26</b>                                        | BP jumped a full band. Her FBS 140 → 91 and TG 136 → 123 improved, but supporting tests cannot rescue a main test |
| <b>Ms. Rajvir kaur</b><br>15:50      | TSH <b>4.46 → 10.71</b>                               | Was just inside the normal range, now far outside                                                                 |
| <b>Mr. Ramesh kumar Gandhi</b> 16:25 | HbA1c <b>6.4 → 8.8</b>                                | Good band → borderline. Biggest HbA1c jump today                                                                  |
| <b>Hardeep singh</b><br>13:05        | HbA1c <b>6.2 → 7.6</b> and<br>TSH <b>11.69 → 55.2</b> | Two main tests worse at once                                                                                      |
| <b>Mrs. Hardeesh Kaur</b> 09:25      | HbA1c <b>6.8 → 7.1</b>                                | Only +0.3 — but it crossed out of the good band (Rule 1 beats Rule 3)                                             |
| <b>Sukhbir Singh</b><br>10:00        | HbA1c <b>7.0 → 7.2</b>                                | Only <b>+0.2</b> , well under the 0.3 threshold — but 7.0 is good and 7.2 is borderline. <b>Band change wins</b>  |

| PATIENT                    | WHAT HAPPENED                    | WHY IT COUNTS AS WORSE                                                                                                            |
|----------------------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Mrs. Evelin pathania 14:35 | SBP <b>+32</b> , HbA1c 6.6 → 5.5 | HbA1c improved but both values are in the good band, so that counts as <i>stable</i> , not <i>better</i> . Only SBP moved → worse |

**Take-away:** a patient can land here on a 0.2 change (Sukhbir Singh) or *despite* an improving HbA1c (Mrs. Evelin pathania). Read the red reason line on each row.

## Getting better — 10 patients · 18%

### Condition

All main tests improved, and no supporting test is a problem. Biggest improvement on top.

### Why these patients are here

| PATIENT                | WHAT HAPPENED                                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------|
| Jastej Singh 13:00     | HbA1c <b>13</b> → <b>9.8</b> (−3.2). Biggest gain today                                                              |
| Sushma rani 15:05      | HbA1c <b>8.1</b> → <b>5.8</b> (−2.3). Borderline → good                                                              |
| Mr. Roshan Lal 16:40   | HbA1c <b>8.6</b> → <b>6.6</b> and SBP improving — both main tests moved the right way. TG also fell 380 → 128        |
| Ms. Arzoo Dhiman 09:35 | SBP <b>−45</b> , the largest BP drop                                                                                 |
| Surinder Kaur 08:50    | SBP <b>−17</b> . HbA1c 6.8 → 7.0 rose slightly, but both are in the good band → stable, so it doesn't block "better" |

⚠ **Better does not mean safe.** Jastej Singh is top of this list at HbA1c 9.8 — still in the bad band. He appears in **Needs extra attention** as well, and he should.

## ⚠ Flag for review — 25 patients

### Condition

The signals **contradict each other**. Four ways to land here:

#### A. Two main tests moving opposite ways

- Mrs. Neelam Kumari — "SBP improving but HbA1c/TSH worsening" (HbA1c 6.7 → 8.0, TSH 2.2 → 5.1)
- Mr. Parmod gill — "TSH improving but HbA1c/SBP worsening"

#### B. Main test improved, supporting test rising

- **Rajinder Mittal** — HbA1c 8.7 → 7.8 ✓ but PPBS **159** → **213** ✗
- **Mr. SURINDER KUMAR** — TSH 5.55 → 3.64 ✓ but TG **126** → **263** ✗
- **Mr. Pawan Kumar Verma** — SBP improving ✓ but FBS **90.6** → **177.5** ✗

#### C. Main test improved, supporting test parked off target

- **Mrs. Tripti Kaur Chandel** — SBP improving, but **TG 421.6**
- **Mrs. Nidhi Bishnoi** — TSH 0.105 → 3.492 (back into range) but **LDL 167, TG 296**
- **Dheeraj Diwan** — HbA1c **7.9** → **5.6** (excellent) but **HDL 34.6**, below target

#### D. Main tests flat, supporting test worsening or off target

- **Mr. Rampal** — HbA1c steady 6.8 → 6.7, but **UACR 3.5** → **42** (kidney signal appearing)
- **Mr. Ravinder Singh Sandhu** — HbA1c steady, but LDL 125 → 137 and TG 173 → 246
- **Sunita ahuja** — HbA1c 4.7 fine, but **eGFR 1.17**, far below target
- **Vipul Virmani** — TG **372** → **321**: falling, but still deep in the bad band

**Why this card exists:** every one of these looks like a success if you only glance at HbA1c. **Do not mark them "improving" without a doctor review.**

## — Stable — 7 patients

### Condition

**Main tests did not meaningfully change** (HbA1c within  $\pm 0.3$ , SBP within  $\pm 5$ ).

| PATIENT                             | READING                                                                           |
|-------------------------------------|-----------------------------------------------------------------------------------|
| <b>Mr. Hakam Singh</b> 11:10        | HbA1c 6.5 → 6.4 — only 0.1                                                        |
| <b>Mr. Dr gc Bansal</b> 08:40       | HbA1c 6.2 → 6.6 — 0.4, but both in the good band (Rule 2)                         |
| <b>Mrs. Nidhi Aggarwal</b><br>13:10 | HbA1c 7.2                                                                         |
| <b>Mr. Ashok Kumar</b> 10:30        | HbA1c 7.6, LDL 123.6 — both borderline, nothing moved                             |
| <b>Mrs. Hemali Angra</b> 09:05      | No HbA1c at all — also appears in "No biomarkers yet"                             |
| <b>Mrs. Rashvinder Kaur</b>         | Listed <b>twice</b> (17:25 and 17:30) — a duplicate appointment, not two patients |

⚠ **Stable ≠ controlled.** Mr. Ashok Kumar at 7.6 is stable but above target. The row only prints an "above target" warning when HbA1c is **above 9** or SBP is **130+**, so a patient can sit here at 7.6 or 8.5 with no warning at all. Check the numbers yourself.

⚠ **Duplicate rows inflate every count** — Mrs. Rashvinder Kaur and Mrs. Babita Bansal each appear twice today.

## ⚠ Needs extra attention — 7 patients

### Condition

**Any one** of these is enough (this list ignores the verdict entirely):

- HbA1c **above 9**
- HbA1c **rising** and now **above 8**
- Medicine compliance **below 60%**

| PATIENT                          | REASON SHOWN        | WHICH RULE                                                                             |
|----------------------------------|---------------------|----------------------------------------------------------------------------------------|
| Ms. Monika Sharma<br>16:15       | HbA1c 10.9%         | Above 9                                                                                |
| Mr. SHAHBU DDIN 13:00            | HbA1c 10.7%         | Above 9                                                                                |
| Jastej Singh 13:00               | HbA1c 9.8%          | Above 9 — <b>also in Getting better</b> (13 → 9.8).<br>Improving fast, still dangerous |
| Alka rani 16:30                  | HbA1c 9.5%          | Above 9                                                                                |
| Mr. Anil Kumar 08:55             | HbA1c 9.2%          | Above 9. FBS 276.8 too                                                                 |
| Mr. Deepak Agnihotri<br>16:50    | Rising from<br>8.3% | 8.3 → 8.8, rising above 8 — <b>also in Getting worse</b>                               |
| Mr. Ramesh kumar<br>Gandhi 16:25 | Rising from<br>6.4% | 6.4 → 8.8 — <b>also in Getting worse</b>                                               |

No compliance-triggered rows today — nobody is below 60%.

## ✅ On track today — 38 patients

### Condition

**Both** must be true:

- HbA1c **7.5 or below**
- and it has **not risen** since last time (or this is the first reading)

This looks at **HbA1c only** — which is why the list is 38 while "Getting better" is only 10.

| PATIENT             | READING   | NOTE                              |
|---------------------|-----------|-----------------------------------|
| Ms. Arzoo Dhiman    | HbA1c 4.4 | Clean                             |
| Mrs. Nidhi Aggarwal | HbA1c 7.2 | Under 7.5 — also in <b>Stable</b> |

| PATIENT            | READING   | NOTE                                                                  |
|--------------------|-----------|-----------------------------------------------------------------------|
| Mr. Sukhbir Singh  | HbA1c 7.3 | Under 7.5                                                             |
| Sunita ahuja       | HbA1c 4.7 | But <b>eGFR 1.17</b> in red — also in <b>Flag for review</b>          |
| Mr. SURINDER KUMAR | HbA1c 4.7 | But <b>TG 262.7</b> in red — also in <b>Flag for review</b>           |
| Mr. Kulbir Singh   | HbA1c 7.3 | But <b>TG 245.4, HDL 34.6</b> in red — also in <b>Flag for review</b> |

⚠️ **"On track" only means the sugar is fine.** Three patients here have red chips for kidney or lipid results. Look at the chips, not just the green background.

Every row today reads "Improving" rather than "Controlled" — that label comes from the patient's saved category, and none are marked controlled.

## ⚠️ No biomarkers yet — 34 patients

### Condition

**No HbA1c recorded**, excluding cancelled and no-show patients.

Examples: Ms. Hemanya Bishnoi 17:10 · Mrs. Gulshan ahuja 17:00 · Mr. Jobanpreet Singh 13:25 · Mr. Randeep Singh 08:30

**Why cancelled/no-show are excluded:** nobody will enter results for a patient who never came, so leaving them in would make this list permanently unfinished. All 34 here are genuine, fixable gaps.

This count matches the coverage warning exactly: **34 missing**.

⚠️ **Mrs. Hemali Angra** 09:05 appears here *and* in **Stable** — she has FBS, LDL and TG on file but no HbA1c.

## Summary — how the sections overlap

| SECTION                                                | BASED ON                                          | EXCLUSIVE?                        |
|--------------------------------------------------------|---------------------------------------------------|-----------------------------------|
| Getting worse / better / Flag / Stable / First reading | Full verdict                                      | <b>Yes</b> — one patient, one box |
| Needs extra attention                                  | HbA1c > 9, or rising above 8, or compliance < 60% | No — overlaps freely              |
| On track today                                         | HbA1c ≤ 7.5 and not rising                        | No                                |
| No biomarkers yet                                      | HbA1c missing, not cancelled/no-show              | No                                |

**Real overlaps today:** Jastej Singh (Getting better + Needs attention) · Ramesh kumar Gandhi and Deepak Agnihotri (Getting worse + Needs attention) · Nidhi Aggarwal (Stable + On track) · SURINDER KUMAR, Sunita ahuja, Kulbir Singh (Flag for review + On track) · Hemali Angra (Stable + No biomarkers).

---

## Three things to watch

1. **9 patients have no verdict** — the five boxes add to 99, not 108.
  2. **The Stable percentage on the trend ring is misleading** — it shows 58% for 7 patients because it absorbs the 25 mixed cases. Use the counts.
  3. **Duplicate appointments exist** (Rashvinder Kaur, Babita Bansal) and are counted twice everywhere.
- 

**Other notes:** click a row to open the visit · Ctrl/Cmd-click opens a new tab · doctor and specialisation filters change every number on the page · green *Live* pill = today, amber *Historical view* = past date.
